

NEGUSTOLONOW: Proposal, Product Requirements and Technical Specification

One document in five parts: what negustolonow is, what it must do, how it is built, the company that will hold it, and what is still open.

1 OCTOBER 2026

PREPARED BY TECHNIBEARS, DETROIT

CONTENTS

Part A · The proposal

1 Summary

2 The problem

3 What we are building

4 Who is doing it

5 What funding would support

6 The road

Part B · Product requirements

7 The people it is for

8 Principles that bind every product

9 The house site

10 The objects and their records

11 Print codes

12 Backroom and the Dummy 13 Arena

13 The game: table and assembly

14 Key rooms and the gamemaster key

15 The card, and data as labour

16 The SESHAT Seed, and the peace table

17 Accessories and chips

18 The workshops

19 Out of scope for now

Part C · Technical specification

20 System overview

21 Accounts and permissions

22 Tokens (Proposed)

23 Proving a physical piece (Proposed)

24 A session, end to end (Proposed)

25 Data

26 Security and failure cases

27 Build order

Part D · The company

28 What the company is, and why a wrapper

29 The contract stack, and the voice and the bookplate

30 The three classes, and how a proposal moves

31 Money

32 Wyoming in Detroit

33 What an attorney will ask, and the answer we bring

34 The order to form it

Part E · Open and closing matter

35 Decisions made, and decisions open

36 Risks

37 Words we will not use, and what we say instead

38 Sources

How to read this

- **Part A, the proposal (sections 1 to 6)** is for funders and mentors, and can be read alone.
- **Part B, the product requirements (sections 7 to 19)** is for partners and anyone who will build, teach or host.
- **Part C, the technical specification (sections 20 to 27)** is for engineers and for FACINGS, the company that will issue the tokens.
- Part D, the company (sections 28 to 34), is for Michigan and Wyoming counsel.
- **Part E (sections 35 to 38)** is for everyone: decisions, risks, the words we will not use, and sources.

Every section ends with a line beginning **State today:**, saying what is built, what is only designed, and what is not started. A section marked *Proposed* is a design written for this document and not yet reviewed by FACINGS or an attorney. Nothing here is legal advice.

REVISION NOTICE / 10 OCTOBER 2026
Parts D and E, pages 35-44, now incorporate the Red Door-aligned company architecture and updated decision/risk terminology. The three technical appendices explain what has NOT been demonstrated. Formation route, partner terms and offerings remain proposed.

PART A

The proposal

1 Summary

negustolonow is a house in Detroit that makes up worlds, makes the objects that belong in them, and teaches other people to do the same. It is the brand over four things that form one loop: a website you walk through instead of scroll, real objects modelled from that world, a workshop curriculum, and a public record for each made thing. That record is a token: an entry on a public ledger that one account holds and can pass to another, usually called an NFT. This document proposes the next stage: print the first pieces, issue their records, open the worlds to play in real rooms, and establish a suitable legal entity to hold the common treasury.

The thesis: Value first. Token second. A token is worth exactly what it is the record of, so we issue one only for something already worth having without it. The house has its own word for this. In Ossel, the first world it made up, every made thing arrives with a **docket**: a small note of what was made and what was done while making it. Nobody wants a docket without a chair. The token is the docket.

Whose intelligence. Your kid already has an AI. The question is whose. This proposal's answer is grown on the block: the SESHAT Seed Project, as introduced by Uri Heru House, in conversation, is exploring a computational intelligence that a neighbourhood stewards itself. negustolonow would feed it by hand, only with work its players have chosen to have credited, and put it to work at a peace table, where two rooms that disagree make something together instead of making speeches (section 16). Nothing of it exists yet.

THING	STATE ON 1 OCTOBER 2026
The house website	Live at technibears.com/negustolonow/. Nothing sold.
Dummy figure workshops	Held at Red Door Digital.
Jewellery: a diffuser, the docket ring, the hours cuff	Print-ready. None printed.
Garments	Specified. None cut.
Backroom's Dummy 13 Arena	Alpha, behind a login.
The ledger account `negustolonow`	Exists since 29 December 2018. One key. No token issued.
The game, the cards, the chips	Designed. Nothing run, issued or bought.

THING	STATE ON 1 OCTOBER 2026
The SESHAT Seed and the peace table	Exploring. Nothing built, trained or run. No two rooms have met.
The company	Not formed. No attorney engaged.

What funding would support. Four lines: the house, the school, the tools and the ledger. Amounts and terms are to be discussed with those sincerely interested. We also ask mentors to help settle the open decisions in section 35.

> **State today:** The house, the curriculum and the Arena exist. The ledger layer, the game and the company are designed and not started. The Seed is exploring, and nothing of it is built.

2 The problem

Three kinds of digital thing lost their value in the same decade, for the same reason: nothing stood behind them.

1. **The game you bought.** It is a licence. It cannot be lent, resold or kept when the store closes. Robot Cache, a store built on resale, closed in May 2026, and its users reportedly lost their games.
2. **The NFT you bought.** It was a receipt for an image anyone could copy. One study in September 2023 found 69,795 of 73,257 NFT collections at a market value of zero; it is one study, and it counted collections. Market sales in 2025 were $5.63 billion, about 37% down on 2024.
3. **The picture you generated.** It belongs to nobody, and it looks like it.

The usual NFT pitch started with the token and went looking for a reason to want it. We reverse the order. A token is issued only for a thing that is wanted without it: an object you can hold, a claim on one print of a design, a game you can play, an item that matters inside a game, or what you kept from an evening in a made-up place. The pattern has a survivor: Courtyard, whose tokens stand for graded trading cards held in a vault, raised a $30 million Series A in July 2025, by its own account.

> **State today:** The thesis is untested against our own goods. Nothing has been sold or issued.

3 What we are building

The curriculum's arc is concept sketch, 3D model, physical print, final pitch. The studio runs that arc in three directions. Each is a product, and play rides on all three.

CROSSING	PRODUCT	PATH	STATE
Physical to digital	Dummy Dolls and "A Box of Kittens"	A figure in your hand, 5,760 photographs, a world on screen	Running.
Digital to digital	negustolonow, the house	A world written in prompts, things you keep, a figure drawn from them	Live and public.
Digital to physical	The Dummy 13 Arena, and the jewellery	A figure or a piece designed on screen, then printed	Arena in alpha. No jewellery printed.
Play	The game, in key rooms	A made piece becomes a piece on a table	Designed.

Physical to digital. The **Dummy figure** is an open, 3D-printable action figure with a 26-step assembly; its base design, Dummy 13, is by soozafone under the CC BY 4.0 licence. A student builds one, then animates it in the stop-motion programme "A Box of Kittens", whose production is "8 Minutes". The curriculum is "Make Your Own, Kid!", taught as STEAM+E+D, and its arc is Action Figure to Action Taker.

Digital to digital. The house is a website you walk through. **Ossel** is a 900-kilometre seawall country where the machines do all the work and hold no authority; Mercy Room, the second world, is one room and four garments. There is a **pocket** on every page: each thing a visitor passes gets one of three answers, Keep it, Not yet, or Leave it. The visit ends on **the step**, where a figure with its back turned is drawn only from what the visitor kept, with a printable docket ending in the word LOOK.

Digital to physical. Backroom is the TechniBears portal at backroom.technibears.com. Its **Arena** (the Dummy 13 Arena) is a 3D parts bench: a user picks a figure, gives each of its thirteen parts a skill, and exports a file a printer can make. What we sell on this crossing is a **print code**: a token that stands for one print of a closed design, made by us. Its holder can keep it, trade it, or redeem it for the piece, and never receives the design file.

Play. The worlds become games played in real rooms. A player opts in, in person, at a **key room**: a room whose keeper holds a **gamemaster key**, a signing key to which the house account gives a narrow set of powers. Players carry made pieces, and a chip inside a piece lets it prove which piece it is. People already pay for this: one platform reports more than $50 million paid to about 5,000 gamemasters since 2019, by its own claim. The product is a format licensed to rooms that already exist, not a venue we build.

Whose. The curriculum's essay, "Make Your Own, Kid!", puts it plainly: your kid already has an AI, and the question is whose. Prompt Craft answers it for one pair of hands: a student learns to hold the tool (section 18). imagINe nation gives the answer somewhere to live: CH313, the neighbourhood's own network, carries messages when the internet is down (section 20). The SESHAT Seed Project, as introduced by Uri Heru House, in conversation, answers it for the block: in the project's words, "a locally

stewarded computational intelligence". Whose? The neighbourhood's. Not rented from a company far away. Grown on the block. Ossel already tells it as a story, where the machines do all the work and hold no authority. negustolonow is where a Seed would be fed, by hand, and where it would be put to work: at a table between two rooms that disagree (section 16).

Under all of it runs one record: a token on **AtomicAssets**, a published standard for tokens, recorded on **Vaulta**, the public blockchain formerly called EOS, shown and traded on the AtomicHub marketplace, and issued from the account `negustolonow`.

> **State today:** Two crossings run today. The third works in alpha. Play and the record are designed. The Seed is exploring: nothing built, trained or run.

4 Who is doing it

TechniBears and Beelal Fakhouri. TechniBears is the Detroit studio that makes the tools: the Bear Engine underneath, Cody as the personal layer, and Backroom as the operator's surface. Technibears LLC is an existing Michigan company. Beelal founded it and wrote "Make Your Own, Kid!", the essay that sets out the curriculum.

Ulysses Newkirk II and Red Door Digital. Red Door Digital is a print shop on Oakland Avenue in Detroit and the first key room; Ulysses holds the gamemaster key there. Red Door incubated TechniBears and built imagINe nation. The workshops are held at Red Door Digital.

Rob Konsdorf, of FACINGS. FACINGS INC., of Southfield, Michigan, will issue our tokens and take payment by "credit cards or cryptocurrency". A public governance statement says FACINGS acquired AtomicHub in September 2025 and took over the stewardship of AtomicAssets. So every layer of the ledger except the chain itself is run from metro Detroit.

imagINe nation. A neighbourhood of maker spaces in Detroit's North End, where people share tools, teach each other, and sell their own work through a common shop, 313af.space. Beelal is a member. It is the proof of concept for the social half of this proposal: people already share rooms, tools and a shop with no ledger at all. This document speaks for the studio only.

The treasury's prospective signers. Beelal Fakhouri, Ulysses Newkirk II, Uri Heru House and Rob Konsdorf are proposed signers, not installed keyholders. Three-of-four is the draft threshold. The account remains controlled by its current single key until a verified permission migration.

> **State today:** The studio, the print shop and the neighbourhood exist. No agreement with FACINGS is signed, and the treasury is still under one key.

5 What funding would support

LINE	WHAT IT PAYS FOR
The house	Printing and cutting the first pieces; the next worlds; the site as entertainment.
The school	Workshop seasons at Red Door Digital; the jewellery curriculum; printers, materials and kits.
The tools	Backroom's Arena, from alpha to a product others can use.
The ledger	FACINGS's work: the collection our tokens are issued under, print codes, chipped pieces, gamemaster actions, game licences and items.

How every workshop is budgeted. Every workshop is budgeted by the method published by Block by Block, the UN-Habitat Minecraft programme in which residents redesign a real public space. We use its published method and say whose it is; no partnership or endorsement is implied. It has seven steps: list all activities, set tentative budgets, assess current resources, identify the funding gap, engage partners, streamline, and validate. Its starting rule is ours too: no workshop is announced until the making is paid for.

Amounts and terms are not set out here. They are to be discussed with those who are sincerely interested.

Or give directly

A gift in bitcoin can be sent to the address below. A gift is a gift: nothing is sold and nothing is promised in return. The address is controlled by the studio's founder today, and it will be recorded in the company's books once the company is formed.

`1KyvVdir4duAHWAqMPxJi66Uu5GRxdKy9u`

The bitcoin address as a QR code, drawn by hand around the TechniBears bear. Check the address before you send.

How quadratic funding would work. Quadratic funding shares out a pool of matching money between pieces of work. Each one's match grows with the number of people who gave to it, not only with the amount: the match is proportional to the square of the sum of the square roots of the gifts. So a hundred gifts of one dollar draw far more matching than one gift of a hundred dollars, and many small givers count for more than one large one. The rules of each round and the size of its matching pool will be published before the round opens. The method's known weak point is telling one person from many, because one giver can split a gift across made-up names. So a giver who wants their gift to count toward matching opts in, in person, at a key room.

> **State today:** The address exists and has received funds before. No round has been run. No matching pool exists. No rules are published.

What a funder's money is in law. One of three things, named before we accept it.

THE SENDER GETS	IT IS	SO
Goods, or a seat in a workshop	A sale	It is taxable.
Nothing, and nothing is promised	A gift, but only if nothing is promised	It is not tax-deductible for the giver, because the recipient (the founder today, the company once formed) is not a qualified charitable organisation.
A return, or a token implied to rise in value	A security	It may be offered only under a named exemption (section 32).

An open decision. The company is designed with a funders' class. Whether that class opens at formation is not decided. The split between the makers' class and the funders' class is also not set; it is to be discussed with further mentorship.

	GRANTS AND SALES FIRST	AN ECONOMIC-INTEREST CLASS FROM THE START
A funder receives	Goods, seats, or nothing promised.	An economic interest in the company.
In law it is	A sale or a gift.	A security, sold under one named exemption.
It requires	A published statement of what each payment is.	A filing, disclosure, and under the intrastate route escrow at a Michigan bank.
It costs	Funders hold no share of any surplus.	Funders may leave with their unspent share, so money cannot be committed years ahead.

> **State today:** Four lines named. No exemption chosen. The company has accepted no funds, because it is not formed.

6 The road

WHEN	WHAT	DONE WHEN
Now	The house is public. The jewellery is print-ready. The Arena exports files. Workshops run.	Anyone can walk the house and read `negustolonow` on a public Vaulta node.
Next	Form the company. Move both accounts off single keys. Print the three jewellery pieces. Create the collection. Prove one chipped piece on the test network, a copy of the chain used for trials.	A stranger can buy a printed piece and read its record on chain.
Then	Jewellery through Prompt Craft workshops. Print codes from the Arena. The first key room opens sessions. Game licences and items on AtomicHub.	A student sells a piece they designed, and a player resells a licence.
Later	The same path for anyone, at any age: other neighbourhoods, other languages, other houses. The assembly game. A first Seed is planted. The peace table: two rooms, two Seeds, one real street.	A world exists that we did not write. A Seed runs in one room, learning only from work the company has voted to license. Two rooms that disagree settle a real question and take it to whoever decides.

> **State today:** The first row is true. Nothing in the second row has started.

PART B

Product requirements

7 The people it is for

The visitor wants an evening somewhere else, and gets a house to walk through with no account, feed or score, and a figure and a docket to keep.

The student wants to make a thing and say why it matters, and gets the path from concept sketch to final pitch, a finished piece, and a record under their own name.

The player wants a game with real objects and other people in a room, and gets a table, a card, a figure, and items that outlast the session.

The keeper, or gamemaster, runs a key room and wants a format that fills it weekly. They get a licence to run it, a key with narrow powers, and pay for their time.

The maker wants to be paid for a piece, and again if it is resold. They get a capped edition, a record that travels with the piece, and a collection fee that marketplaces are encouraged, not forced, to pay.

The funder wants to know exactly what their money buys, and gets a named classification, a public record of every vote and payment, and state lines that say what exists.

> **State today:** Visitors and students exist. No player, keeper or funder has been admitted.

8 Principles that bind every product

1. **Value first.** No token is issued for anything not already worth having without it.
2. **Say what exists.** Every surface carries a state line. "None printed" stays until a piece is printed.
3. **The school is open and the house is closed.** The Dummy figure and the curriculum can be taken apart by anyone, and students own their files. The house's design files stay with us; the made piece is what is sold.
4. **Consent is an object you hold.** A card held out in the room means yes. A card put away means not now.

5. **Nothing personal on chain.** Not a name, not an age, and not a hash of either. A hash, also called a fingerprint, is a short code computed from a text.
6. **No reward that is a coin.** Nothing depends on a token's price.
7. **No paid entry into anything decided by chance.** Items are awarded for what a player did.
8. **Children are students, not labour.** Their work is credited to them and held for them. Nothing is paid.

> **State today:** Principles 1 to 3 are practised on the live site. The rest are written rules for products not yet built.

9 The house site

The house is a static website that a visitor walks through. It is the setting for everything else and entertainment in its own right: closer to a novel you walk around in than to a shop.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
HS-1	The house pages must hold no accounts and make no network calls of their own.	yes	A browser's network log shows only the page's own files.
HS-2	Every page must carry the pocket, with exactly three answers: Keep it, Not yet, Leave it.	yes	Every page shows both.
HS-3	The step must draw the figure only from what was kept, with no randomness, and give a code that rebuilds it exactly.	yes	The code redraws the same figure on another device.
HS-4	The pages must not show points, badges, streaks, counts or a feed, and must not use the words NFT, token or game.	yes	A review and a text search find none.
HS-5	Entering a figure on the ledger must happen on a separate claim page.	no	A figure is entered by its code, and HS-1 still passes.
HS-6	The three published Mercy Room objects must stay free to download, dedicated to Onyx Ashanti.	partly	The dedication is on the page.

Non-goals:

- A shop front on the house pages.
- Turning the site itself into a game.

> **State today:** Built and public. The claim page is not built, and the dedication line is not yet on the site.

10 The objects and their records

The objects are the goods: jewellery from Ossel, sculpted objects and garments from Mercy Room, and Dummy figures. Each piece sold carries its number in the seam, and that number opens its record.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
OB-1	Every piece sold must carry its number in the seam, in the form `0NN-EEE`, and the number must open its Record page.	partly	A made piece's tag opens its page.
OB-2	Each made piece must have one token stating its object number, piece number and material.	no	The token is visible on AtomicHub under `negustolonow`.
OB-3	An edition's size must be fixed on the ledger before its first piece is entered.	no	The maximum supply can be read on a public node.
OB-4	Design files for new products must not be published or sold.	yes	No new product page offers a file.
OB-5	A piece's record must be transferable with the piece.	no	A second holder shows on the record.
OB-6	A state line must stay true until a piece is printed or cut.	yes	Each page matches what has been made.

Non-goals:

- Closing the Dummy 13 base figure, which is soozafone's and stays open.
- Holding stock of unsold pieces.

> **State today:** The Record page and number format exist. Three jewellery pieces are print-ready, none printed. No record issued.

11 Print codes

A print code is a claim on a piece that has not been made yet. Because the edition is capped on the ledger, a code for piece 7 of 9 is scarce in a way anyone can check.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
PC-1	A code must stand for exactly one print of one closed design, made by us or a maker licensed in writing, and must never deliver the design file.	no	One code yields one piece and no download.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
PC-2	The holder must be able to keep, trade or redeem the code.	no	Each is done once on the test network.
PC-3	The edition must be capped as the maximum supply of the template, the pattern its tokens are made from.	no	Issuing one more than the cap fails on chain.
PC-4	On redemption the code must be marked redeemed or burned (destroyed), and the piece's record must take over.	no	A second redemption is refused.
PC-5	A buyer must be able to pay by card, without holding cryptocurrency.	no	A purchase completes with a card alone.
PC-6	A code must not be redeemed for money, and its plain terms must be published before the first sale.	no	The terms are public and an attorney has read them.

Non-goals:

- Download and print at home. The right to print means we print it for you.
- A token that licenses a maker. A manufacturing licence is a signed contract for a fixed number of pieces.

> **State today:** Defined. Nothing built. We found nobody who sells a claim on a 3D print as a token, so there is no model to copy.

12 Backroom and the Dummy 13 Arena

Backroom is the portal onto the engine: a chat that builds a playable game from a prompt, and the Arena, a parts bench set in Jaglavak 1963, one of the studio's worlds.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
BR-1	The Arena must let a user pick a figure, give each of its thirteen parts a skill and an augment, and detach and pose them.	yes	A new user does this without help.
BR-2	The Arena must export a printable file for the open Dummy 13 base only.	partly	An export of a house design is refused.
BR-3	A figure's parts list (part, skill, augment, colour) must be recordable as a print code, and house parts must print only against one.	no	An Arena design is issued as a code on the test network.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
BR-4	The Arena must read a tap from a chipped part and give the figure that part's skill.	partly	A tapped part changes the figure on screen.
BR-5	The chat must build a playable game from a prompt.	yes	A new user asks for a game and plays it.
BR-6	Every surface that shows the Arena or sells a Dummy 13 print must credit soozafone under CC BY 4.0.	not checked	An audit of every such surface finds the credit.

Non-goals:

- Publishing the house's design files through the Arena.
- A store for other publishers' games.

> **State today:** Alpha, behind a login, and it works: figures load, parts detach, skills assign, files export. Nothing from it is on the ledger.

13 The game: table and assembly

At the **table**, three to eight players and a gamemaster play a session set in a made-up place, Ossel first. At the **assembly**, tables or whole rooms send delegates to negotiate a real question, such as a shared tool, and vote on it. Carried one step further, with a Seed in each room, the assembly becomes the peace table (section 16).

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
GM-1	A table session must run with three to eight players and one gamemaster in one room.	no	One session is run to the end.
GM-2	A session must leave a docket of what was made and done, ending in LOOK.	no	The docket is printed and entered on the record.
GM-3	A player must be able to bring the figure from the step as their character, by its code.	partly	A code from the step loads at the table.
GM-4	What a part does in play must follow the Arena's skills: speed, shield, sensor, flight, map-shift, repair and echo.	partly	A written rule sheet covers all seven.
GM-5	The game must not charge entry to anything decided by chance.	no	The rule sheet has no paid draw.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
GM-6	An assembly must end in a recorded decision that named humans ratified.	no	One decision and its ratifiers are on the record.

Non-goals:

- Building a venue, or putting the game on the house's pages.
- Claiming that role-play teaching is proven. The evidence is promising and modest.

> **State today:** Designed. The rules that join the Arena, the step and the Dummy figure are not written. No session run.

14 Key rooms and the gamemaster key

A play space is any room where the game is played. A key room is a play space whose keeper holds a gamemaster key. It is the only place a player can opt in. A scoped permission is a signing power limited to named actions.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
KR-1	Nothing about a person must be recorded until they have opted in, in person, in front of the keeper.	no	No record predates its player's opt-in.
KR-2	A room must become a key room only by a recorded vote, a scoped permission on the house account, and a signed format licence.	no	All three exist for Red Door Digital.
KR-3	A gamemaster key must be able to open and close sessions at its own room, countersign presence, issue cards, enter dockets and hand out awarded items.	partly	Each action is run once from the room's permission.
KR-4	A gamemaster key must not be able to move treasury funds, touch a player's account, exceed an edition cap, act for another room, or change its own permissions.	yes	Each attempt is refused on the test network.
KR-5	A room's status must be read from the house account on chain, never from an account's name, and must be removable by vote.	partly	A test room is admitted, shown on a public node, and removed.

Non-goals:

- Opting in online.

- Rooms that the company owns or builds.

> **State today:** One key issued, with nothing linked to it. No room licensed, no session opened.

15 The card, and data as labour

Every player who opts in receives a card tied to their key. Held out in the build space, the room where players make things, it means the player's work may be recorded and credited to them. The idea is from Eric Posner and E. Glen Weyl's *Radical Markets* (2018): the data people produce is work, and they should bargain over it together.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
CD-1	Every player who opts in must receive a card that carries no name and no personal data.	no	A read of the first card's chip shows neither.
CD-2	The card must have three states: out in the build space, away, and handed back.	no	Out records the session under the player's key; away records nothing.
CD-3	Only what a player deliberately does with the tools while the card is out may be recorded.	no	The room uses no cameras, microphones or biometrics.
CD-4	Pooled data must be licensed only by a vote of the players concerned, with proceeds paid to their own accounts.	no	One licence is voted and its payments are on the record.
CD-5	A player who hands the card back must keep everything already credited.	no	A returned card leaves the account unchanged.
CD-6	Players under 18 must take part as students, unpaid, and nothing about a child under 13 may be collected without a parent's verifiable consent.	partly	The player agreement says so, and each such record has a consent.

The promise is narrow and true:

> *A receipt for your work, a say in who uses it, and your share if it is ever sold.*

What is credited is also the only thing a Seed may ever be fed, and only by vote (section 16).

Non-goals:

- Surveillance of a room.

- A promise of income. Data as labour has rarely been made to pay.

> **State today:** Designed. No card issued. No data collected.

16 The SESHAT Seed, and the peace table

Whose? The neighbourhood's. The SESHAT Seed Project, as introduced by Uri Heru House, in conversation, is exploring an intelligence that a community grows and keeps for itself. Not rented from a company far away. Grown on the block. negustolonow is where a Seed would be fed, and where it would be put to work: at a table between two rooms that disagree. Nothing of it exists yet. This section sets the rules it would keep from the first day.

What the Seed is

In the project's own words, it is "a locally stewarded computational intelligence that can learn, remember, and grow in relationship with the people and communities it serves". It is called a Seed because it does not arrive finished: the project is creating, again in its words, "a foundation from which one can grow", and the seed carries seven principles: stewardship, trust, respect, curiosity, shared responsibility, resilience and regeneration. A finished thing can be rented. A seed has to be planted somewhere, by someone.

Prompt Craft puts one pair of hands on the tool (section 18). CH313 gives the neighbourhood its own network (section 20). The Seed is what the block would grow on it, and it answers to the block. The project's rule is the mesh's own: "Local does not mean isolated." A community keeps its own knowledge and its own infrastructure, and stays on speaking terms with everyone else.

What it is fed

Data as labour is the Seed's diet, and the card is the switch. What players deliberately make and decide in the build space, cards out, is credited to each of them (section 15). Pooled, that record is the only thing a Seed may learn from, and only once a recorded vote of the company, cast by the players concerned (section 30), has licensed that use. Fed by hand. Never by watching.

THE STATE	FOR THE PLAYER	FOR A SEED
Card out in the build space	Their work is recorded and credited under their key.	It may learn from the pooled record, only after a recorded vote.
Card away	Nothing is recorded.	It learns nothing about that player. No card, no dinner.
Card handed back	They keep everything already credited.	It takes nothing more.

THE STATE	FOR THE PLAYER	FOR A SEED
Data key deleted	Their records are erased.	No promise that it forgets.

No cameras. No microphones. No biometrics. Only what a person does with the tools, on purpose, card out. Under-18s take part as students, not as paid labour: their work is credited to them and held for them (section 8).

How trust is grown

SESHAT does not assume trust, and does not try to do without it. In the project's words, it wants trust to develop "through relationship, transparency, verification, shared experience, and demonstrated responsibility". Here, verification has a plain form: every claim is signed by whoever makes it.

THE CLAIM	WHO SIGNS IT
"I was there"	The player's own key
"They were there"	The room's gamemaster key
"This session made this docket"	The room's gamemaster key
"The Seed may learn from this"	A recorded vote of the company, executed by the keyholders

A presence counts only with two signatures (section 24). A Seed holds no key and signs nothing. Nobody signs for anybody else. Trust is grown, not assumed.

The peace table

The assembly already sends rooms to negotiate a real question (section 13). The peace table carries it one step further, and it is a peace-building endeavour. Each room grows its own Seed. When two rooms that disagree meet, they do not start with speeches. They start with something to make.

- **On the table:** objects, dockets, models, moves in a game, proposals.
- On the books: a trade, shared budget, or proposed matching round only if funded.

The Seeds carry and translate. Each brings what its block knows, in a shape the other side can pick up. People decide and ratify: no Seed signs for anyone, and nothing is settled until named humans in both rooms ratify it, as at the assembly (GM-6). Settle one real question, and the words can wait.

> *Skip the speeches. Make something together.*

The divide is always local and always concrete: two rooms, two blocks, two sides of a street. It is bridged by making something together, not by agreeing on words first. The evidence for role-play and Model United Nations learning is real but modest, so this is promising and not proven, and no outcome is claimed.

A nod to Block by Block

The peace table is played on a real place. That is a nod to the UN-Habitat Minecraft programme, Block by Block, in which residents rebuild a real public space in Minecraft, redesign it together, and put it in front of the officials who decide. We already use its budgeting method (section 5). Here we borrow two more of its moves, as an experiment:

1. **The board is the real street, in blocks.** A street, a lot or a square, modelled so both rooms can walk through it. Both sides build on it: proposals, trades and a shared budget, laid on the model where both can see.
2. **The result goes on the desk of whoever decides.** A landlord, a block club, a city department.

Put the street on the table. The model is the board, and the real street is what is being negotiated.

We take its warning too. Block by Block warns that participatory design without a serious commitment to build can raise false hopes and damage future civic participation. In our words: we don't hand out pencils for streets nobody means to build. As in section 5, no partnership or endorsement is implied. The programme's core funding was reportedly cut in 2025, so we will confirm its current form before anything is built on it.

Requirements

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
SD-1	A Seed must learn only from the pooled record of work done with cards out, and only after a recorded vote of the company licenses that use.	no	A licence vote is on the record before a Seed reads anything.
SD-2	A Seed must learn nothing about a player whose card is away or has been handed back.	no	A session with a card away leaves nothing of that player for a Seed to read.
SD-3	Nothing a Seed reads may come from a camera, a microphone or a biometric reading.	no	The room holds none of the three.
SD-4	Every record a Seed reads must be signed by whoever made it, and a Seed must hold no key and sign nothing.	no	An unsigned record is refused, and no action accepts a Seed's signature.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
SD-5	Deleting a player's data key must erase their records, and no term may promise that a Seed forgets.	no	A deleted key leaves nothing readable, and the player agreement promises no more.
SD-6	At the peace table a Seed may carry and translate, and every outcome must be ratified by named humans in both rooms.	no	One outcome and its ratifiers from both rooms are on the record.
SD-7	A real place must not be put on the table unless whoever decides about it means to build.	no	A written commitment from whoever decides exists before the model is started.

What this is not

- **Not built.** SESHAT is exploring; in the project's words, the Seed is "our attempt to begin cultivating" a possibility. No Seed has been built, trained or run, and it learns from nobody today.
- **Not a mind.** It is a computational intelligence, in the project's term, and nothing more is claimed for it.
- **Not a wage.** What a Seed is fed is credited to the people who made it. Data as labour has rarely been made to pay, and nothing here promises an income.
- **Not forgetting.** Deleting a player's data key erases their records. It does not prove that anything a Seed already learned from them is forgotten. How a Seed holds what it learns is an open design question.
- **Not a judge.** Seeds carry and translate. People decide and ratify.
- **Not a peace claim.** No two rooms have met. No model of a real place has been built. No outcome is claimed.
- **Not a partnership.** Block by Block is a nod, and an experiment.

> **State today:** Exploring. Nothing built, trained or run. No card issued, no data collected, no Seed fed. No two rooms have met, and no model of a real place has been built.

17 Accessories and chips

An accessory is a house object that also does something at a table. It has three layers, in this order: the thing, worth wearing with no game at all; the record, its token; and the function, what tapping it does. NFC is the short-range radio a phone uses to read a tag by touch.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
AC-1	Each accessory must be worth wearing or keeping with no game at all.	partly	A piece is sold to someone who does not play.
AC-2	Anything that trades must carry a signing chip whose private key cannot be read out.	no	One printed piece holds one such chip.
AC-3	Cards and low-value items may carry the cheaper chip, and must be labelled "verified by the house".	no	The label is on the card and in the terms.
AC-4	A plain NFC tag must not be used for anything of value.	yes	No piece record points at a plain tag.
AC-5	A tap must be readable in a phone's browser with no app, and a signing chip's tap must be checkable on chain without our server.	no	The check passes with our server switched off.
AC-6	Pieces must be made to order against a print code.	no	No accessory is produced without a redeemed code.

Non-goals:

- A yearly line of figures. Earlier toys of this kind failed on unsold stock; one publisher took a $147 million charge.
- Any reward that is a coin.

> **State today:** Designed. No chip bought, no contract written.

18 The workshops

The school is "Make Your Own, Kid!": STEAM+E+D, which is science, technology, engineering, art and maths plus entrepreneurship and design. Its foundation is Prompt Craft, a way of making a clear request with four concepts: Subject, Action, Context, Style. The new line is jewellery making through Prompt Craft, with the docket ring on the table when the class starts.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
WS-1	A workshop must not be announced until the making is paid for.	partly	Its budget is validated before its announcement.
WS-2	Every student who designs a piece must leave with the piece.	partly	Finished pieces equal students.

ID	REQUIREMENT	EXISTS TODAY	DONE WHEN
WS-3	Every workshop must be budgeted by the seven steps in section 5 and validated by a recorded vote of the company.	no	A filled sheet and its vote exist for the first season.
WS-4	If money falls short, activities must be cut and the making must not be.	no	A reduced budget shows fewer students before fewer finished pieces.
WS-5	The curriculum must stay open, students must own their files, and Prompt Craft must be taught as four concepts.	yes	Every handout names the four.
WS-6	A jewellery student must write a small world, describe one object from it, model it, print or cast it, enter it on the ledger, and offer it through 313af.space.	no	One student completes all six.

A budget sheet is drawn up for each season before it is announced.

COST HEADING	WHAT IT COVERS FOR US
Personnel and experts	Facilitators, the keeper, the print technician, the modeller, guest makers.
Technology and hardware	Printers, filament and resin, casting supplies, computers, a connection, cards and chips.
Design and consultation	The starting model, expert design time, the validation meeting.
Operations and supplies	Meals, water, stationery, the room.
Advocacy and outreach	Flyers, briefs and the docket slips.
Making and after	Printing, casting, finishing, the seam number, the record; then maintenance and evaluation.
Logistics	Travel, contracted services, and grants to the rooms that host.

Non-goals:

- A workshop that ends in a file and an apology.
- Paying young people for data or for play.

> **State today:** Dummy figure workshops held. Jewellery workshops planned. No season's budget sheet has been drawn up yet.

19 Out of scope for now

- **The wider Block by Block method.** Modelling a real street and taking residents' designs to the people who decide comes later. Only the budgeting method is used now. The peace table's street (section 16) is part of that later work.
- **The assembly game on a real street.** It is designed for rooms first.
- **Planting a Seed.** Section 16 sets the rules a Seed must keep. Growing one, feeding one and seating two at the peace table come later (section 6).
- **A community currency.** No token here is money or is redeemed for money.
- **Zero-knowledge proofs.** On this chain they are research.
- **Any token whose value is its price.**

> **State today:** None of these is started, by decision.

PART C

Technical specification

20 System overview

COMPONENT	WHAT IT DOES	WHO RUNS IT	STATE
The house site	Static pages. No accounts and no network calls of its own.	TechniBears	Live.
The claim page	Enters a figure on the ledger by its code.	TechniBears, with FACINGS	Not built.
Backroom and the Bear Engine	The chat that builds games, and the Arena.	TechniBears	Alpha.
The chain account `negustolonow`	Authors the collection and holds the treasury.	One key today. Later the four keyholders.	No token issued.
FACINGS	Mints (creates) and launches tokens; takes card or cryptocurrency.	FACINGS INC.	No agreement signed.
AtomicHub	The market where tokens are shown and traded.	FACINGS, by its public statement	We have no collection there.
The session and chip contract	Checks a tap; carries the gamemaster actions.	Written with FACINGS	Not written.
The card server	Checks a tap on the cheaper chip.	The house	Not built.
The key rooms	Hold a gamemaster key, run sessions, print.	Each keeper. Red Door Digital first.	One key held.
The record store	Holds encrypted session records, off the chain.	The company	Not built.
The mesh	CH313, low-power radios that carry messages when the internet is down.	The neighbourhood	Not used by the game.
A Seed	A computational intelligence a community stewards, reading only pooled records licensed by vote (section 16).	The community that grows it, with the company as steward	Not built. SESHAT is exploring.

How one printed ring travels through them.

1. The design file stays in the studio. With FACINGS, the company creates a template for the ring under the `negustolonow` collection, with a fixed maximum supply.
2. A buyer pays by card on a launch page and receives a print code for one numbered piece. They may trade it on AtomicHub.
3. Whoever holds the code redeems it. The ring is printed or cast at the print shop, and a signing chip is set inside.
4. The piece record is issued with the ring's object number, piece number and material, and the chip's public key is registered against it.
5. The ring goes out with its number in the seam, which opens the Record page.
6. At a table in a key room the ring is tapped. The contract checks the chip, and the Arena applies the ring's function.
7. If the ring is sold, its record goes with it. The token stays on the chain whatever happens to the marketplace.

> **State today:** The first three components run. The rest is unbuilt.

21 Accounts and permissions

How an account is controlled. A key is a pair: a private half that signs, and a public half anyone can check a signature against. A Vaulta account has named permissions, each a threshold plus a list of weighted keys. A **multisig**, short for multi-signature, is a permission that needs more than one key. The action `updateauth` changes a permission. The action `linkauth` binds a permission to one specific action, so that it can do that and nothing else.

Facts verified on chain on 1 October 2026:

- `negustolonow` was created on 29 December 2018. No contract is deployed on it. Its `owner` and `active` permissions each have one key.
- On 27 September 2026 it gained a permission named `wilibansqnfa` under `active`, with nothing linked to it.
- `negustolo.gm` was created on 25 September 2026 by the account `gm`. Its active key is the same public key as `wilibansqnfa`.
- `negustolonow` has authored no AtomicAssets collection.

So the gamemaster key already sits on the house account as a separate permission, and today it can authorise nothing. Authority is added one action at a time. The name proves nothing: anyone can get a name ending in `.gm`. A room is a key room because the house account says so on chain.

The permission ladder. The four keyholders are Beelal Fakhouri, Ulysses Newkirk II, Uri Heru House and Rob Konsdorf.

	TODAY	STEP 1	STEP 2	STEP 3
`owner` of `negustolonow`	One key	A multisig of the four keyholders, three of four	Unchanged	Keyholders changed only by vote
`active`	One key	Unchanged	Three of four. Every payment goes through `eosio.msig`: propose, approve, execute.	Unchanged
Gamemaster	`wilibansqnfa`, nothing linked	Unchanged	Bound by `linkauth` to named game actions only	One scoped permission for each admitted room
Players	None	None	First adult players, on their own accounts	Recovery set for every player
Our own contract	None	None	None	Deployed only if a vote approves

`eosio.msig` is the chain's built-in multisig contract. The threshold of three of four is to be confirmed. Each keyholder makes their key on their own hardware device; no key is copied, typed into a chat or kept in a shared file.

What a gamemaster permission is linked to. The actions in KR-3 (section 14), each limited by the contract to that permission's own room.

Player accounts and recovery. A player's `active` permission is their own key alone, so spending never needs anyone else. Their `owner` permission is two of three: the player, a person they choose, and the house. The house alone can do nothing, and uses its share only at the player's request, in person at a key room. A phone's passkey may be used for convenience and must not be the only key. A child never holds sole keys; a parent or guardian holds the recovery share.

> **State today:** Both accounts are single-key. If either key is lost, that account is lost. No step taken.

22 Tokens (Proposed)

The collection. One AtomicAssets collection, authored by `negustolonow`. The standard supplies what the design needs: only authorised accounts can mint; a template can carry a fixed maximum supply;

some data is fixed at minting and some can change; and each template has a switch for whether its tokens can be transferred or burned.

KIND	STANDS FOR	EDITION RULE	TRANSFERABLE	FIXED AT MINTING	CAN CHANGE LATER	WHO MAY MINT
Kept figure	The figure the step drew from what a visitor kept.	One for each claim. No cap.	Yes	The figure's code and the date.	Nothing.	The claim page.
Piece record	One made piece.	Maximum supply equals the edition.	Yes, with the piece.	Object number, piece number, material.	Who watched it made; its chip registration.	The company, through FACINGS.
Print code	A claim on one print of a closed design.	Maximum supply equals the edition.	Yes, until redeemed.	The design and piece number.	Issued or redeemed.	The company, through FACINGS.
Card and access token	A player's opt-in, and access to rooms, tools and print time.	One for each player.	No	The issuing room.	Active or handed back.	That room's gamemaster permission.
Game item	A thing that matters in play, such as a part that gives a figure its skill.	A cap set by vote.	Yes, between players.	What it is and does.	The sessions it was used in.	A gamemaster permission, inside the cap.
Game licence	The right to play a game our own engine made.	A cap set at publication.	Yes: lent, resold or handed down.	The game and a fingerprint of its terms.	Nothing.	The company, through FACINGS.

Game licences are issued first only for games our own engine makes, because a licence is worth what the game that honours it is worth. No token is described as "backed": on Vaulta the standard lists only EOS as a backing token.

The life of a print code.

1. **Issued.** Minted from a capped template and sold. It names the design and the piece number.
2. **Traded.** The holder keeps it or passes it on.
3. **Redeemed.** The holder asks for the piece. The code is marked redeemed, or burned.
4. **Made.** The piece is printed or cast by us or a licensed maker. No file goes to the holder.

5. **Record takes over.** The piece record is minted to the holder with the seam number.

> **State today:** Proposed. No collection, template or token. FACINGS has not confirmed that its tools run on Vaulta.

23 Proving a physical piece (Proposed)

A plain NFC tag can be copied, proves nothing, and is never used for anything of value. Two chips are used.

CHIP	WHAT A TAP PROVES	WHO MUST BE TRUSTED	USED FOR
NTAG 424 DNA, under a dollar in volume	A fresh code on every tap, checked by the house's server, which holds the same secret as the tag.	The house.	Cards and low-value items, labelled "verified by the house".
A signing chip such as HaLo by Arx, about $25 each in small numbers	The chip holds a private key that cannot be read out, and signs a challenge anyone can check.	Nobody, for the check itself.	Jewellery, numbered pieces, anything that trades.

The tap check, for a signing chip.

1. When the piece is made, the chip's public key is registered against the piece record in the contract.
2. The checker, a phone's browser or the room's device, builds a challenge: the piece's identifier, the holder's account, and a fresh number the contract has not seen for that chip.
3. The chip signs the challenge.
4. The contract recovers the signing key with the chain's signature-recovery function, `assert_recover_key`, and compares it with the registered key.
5. If they match, the result is recorded and the fresh number is spent. If not, the action fails.

The proof does not depend on our server. We found nobody who has built this on Vaulta; the published standards for it are written for another chain.

What it does not prove.

- It proves the chip, not the object. A chip can be dug out and set in something else.
- It does not prove the person tapping is the holder, unless the holder's key also signs.

So we say "this piece carries the chip tied to this record", and nothing stronger.

> **State today:** Proposed. No chip bought, no contract written.

24 A session, end to end (Proposed)

1. **Opt-in.** On a first visit to a key room the player opts in, in front of the keeper. Their wallet shows the player agreement as a Ricardian clause, the plain-language term attached to the action being signed (section 29), and the player signs with their own key.
2. **Card.** The room's gamemaster permission signs the issue of a card.
3. **Opening.** The gamemaster permission signs the opening of a session at its own room.
4. **"I was there."** The player puts the card out and signs a presence message with their own key, over the session's identifier and a fresh number.
5. **"They were there."** The keeper countersigns with the gamemaster permission.
6. **Play.** Each event is signed by the player who made it. A tap is signed by the chip in the piece.
7. **Record.** Each player's part of the session record is encrypted on their own device with their own data key, then stored off the chain.
8. **Docket.** The keeper closes the session and signs the docket: what was made and done, by account and by piece, with no personal data. A fingerprint of the docket goes on chain.

The two-signature rule. A presence counts only with both signatures, the player's and the room's. Neither can create attendance alone.

With the internet down. The mesh is transport, not security: its channel encryption uses a shared key with no authentication, so anyone with that key can pose as anyone. So every event and presence is a signed message, which fits in one radio packet. The room's device checks each signature against the player's public key, drops anything else, and keeps the messages in order. When a connection returns, the keeper submits them, and the contract checks the same signatures before entering the docket. Until then the session is provisional on the record.

> **State today:** Proposed. No action exists and no session has run.

25 Data

DATA ITEM	WHERE IT LIVES	ENCRYPTED WITH WHOSE KEY	WHO CAN READ IT	HOW IT IS ERASED
Account names, votes, payments, tokens, chip public keys	On chain	Not encrypted	Anyone	It cannot be. So nothing personal is put there.
The docket's fingerprint	On chain	Not encrypted	Anyone	It cannot be. The docket holds no personal data.
A player's session record	Off chain, in the record store	The player's own data key	The player	The data key is deleted.
Wrapped (encrypted) copies of data keys	Off chain, with the company	A company key split among the four keyholders	Nobody, until the players concerned vote to license pooled use	Deleted with the data key.
What a Seed may read: signed records in a pooled use the players have licensed	Off chain, in the record store	The players' own data keys, opened only under the licence	A Seed, for that licensed use only	The data key is deleted. That erases the records, not what a Seed may already have learned from them.
The member register, legal names, ages, bank details, identity checks	Off chain, in the company's records	The company's key	The managers and the attorney	Under the operating agreement's retention rule.
Voice recordings and bookplates (section 29)	Off chain, in the company's records	The company's key	The managers	As above. No minor's voice is recorded.
Card secrets for the cheaper chip	The card server	The house's key	The house	The card is retired and its secret deleted.
What a visitor kept in the house	The visitor's own device, and the figure's code	Not applicable	The visitor, and anyone given the code	By the visitor.

The rules.

1. **Nothing personal goes on the chain**, and not an encrypted or hashed version of it either. A chain cannot forget, and regulators have said that a hash of personal data is still personal data.
2. **Encryption happens on the player's device**, before a record leaves it.
3. **A vote comes before any pooled use.** The company holds wrapped keys only so that the players concerned can license the pooled record.

4. **Show only what is asked.** A player who must prove one fact shows that fact alone. The standards are W3C Verifiable Credentials 2.0 and SD-JWT (RFC 9901).
5. **A Seed reads only what is signed and licensed.** It may read a pooled record only after the players concerned have voted the licence and the keyholders have executed it, and only records signed by whoever made them: the player's key for their own work, the room's gamemaster key for the docket. It holds no key of its own and signs nothing. No camera, microphone or biometric reading exists for it to read.
6. **Erasure is of records, not of learning.** Deleting a player's data key erases their records. It does not prove that anything a Seed already learned from them is forgotten, and nothing here promises that it is. How a Seed holds what it learns is an open design question, to be settled before any Seed is fed.

> **State today:** Rules written. No record store, no data key, no data collected. No Seed fed.

26 Security and failure cases

WHAT CAN GO WRONG	THE DESIGNED RESPONSE
A treasury keyholder loses a key, or has it stolen.	Three of four still reach the threshold, and one key alone moves nothing. After a recorded vote the other three replace it.
A player loses their key.	Their chosen person and the house restore it, at the player's request, in person at a key room.
A chip is moved to another object.	A tap cannot detect it. The record names the object, material and seam number, so a mismatch is visible.
A card is copied or lent.	Presence also needs the player's own signature.
A room misbehaves.	Its permission runs only its linked actions, for its own room. A vote removes it.
The marketplace changes hands.	AtomicHub has done so before. The tokens live on the chain.
The mesh is spoofed.	Every message is signed by the player's key, and nothing counts until it settles on chain.
A child's account.	A parent or guardian holds the recovery share, and nothing is paid.
A payment arrives that nobody can classify.	It is held unspent and never treated as buying an interest.
Personal data is written on chain by mistake.	It cannot be erased, so no action accepts free text from a player.
A Seed's output is taken as a decision.	A Seed holds no key, so no action accepts its signature. A proposal it carries counts only when people vote and named signers execute it.

> **State today:** Designed responses only. Until step 1 of the ladder, one lost key loses the account.

27 Build order

1. **Back up today's two single keys.** Proof: a signed key register, kept off the chain.
2. **Prove one chipped piece on the test network.** Proof: a tap on one printed piece, checked in a transaction anyone can read.
3. **Prove one card on the cheaper chip.** Proof: a tap accepted by the card server, and a copied tag refused.
4. **Take step 1 of the ladder**, once the operating agreement names the account. Proof: a public node shows four keys and a threshold of three on `owner`.
5. **Take step 2.** Proof: one executed `eosio.msig` transaction.
6. **Create the collection**, on the test network first. Proof: it is visible on AtomicHub with a readable maximum supply.
7. **Enter the first printed piece.** Proof: a stranger reads its record from its seam number.
8. **Run the print-code cycle.** Proof: one code issued, traded, redeemed and replaced by a piece record.
9. **Build the claim page.** Proof: a figure entered by its code, with the house pages still making no network calls.
10. **Run one session** at Red Door Digital. Proof: one presence with two signatures, and a docket entered.
11. **Run one session over the mesh with the internet down.** Proof: the docket entered after the connection returns.
12. **Set recovery for every player.** Proof: one account restored in a drill.

> **State today:** Milestone 1 has not been started.

28 The wrapper and the choice

Negustolonow is a creative house and workshop programme, not a real-estate company. Its proposed legal wrapper would hold the common treasury, make contracts, employ or pay makers, licence the game to rooms, and administer rights that participants deliberately grant. This is an adaptation of the Red Door Digital DAO architecture, not a claim that the two organisations are the same.

The Red Door route, translated

Option 1 - Wyoming DAO LLC, operating in Michigan. The Red Door blueprint calls for a Wyoming DAO LLC and, when its Detroit activities constitute transacting business, a Michigan Certificate of Authority for a foreign LLC. Wyoming has a DAO-specific statute (W.S. 17-31), with required naming, registered agent, public smart-contract identifiers where applicable, and notice of possible restrictions on duties and transfers. A member-managed structure is the proposed starting point because no automated governance contract exists.

Option 2 - Michigan LLC governed by a DAO-style agreement. This was the route in the previous version. It avoids maintaining a Wyoming entity plus Michigan foreign qualification. It can write member voting, multisignature treasury approvals and online ratification into its operating agreement, but it must not call itself a Wyoming statutory DAO LLC.

A decision with consequences

The two routes cannot be blended by rhetoric. A Wyoming registration is not a Michigan-organised issuer. In particular, Michigan MILE intrastate crowdfunding requires an issuer organised under Michigan law, among other conditions. If a Michigan-only securities offering matters, that is a material reason to prefer or separately examine the Michigan route. A securities attorney must resolve the structure before creating Class B interests.

Wyoming-specific operating duties matter: the statutory notice on member rights, article/smart-contract amendments, the registered agent and annual filings, and dissolution after one year without approved proposals or action. The agreement should set a real governance cadence, not a sham heartbeat.

> State today: No new company has been formed, no route approved by counsel, and no members admitted. TechniBears LLC is an existing, separate Michigan company.

29 The contract stack

Red Door supplies the organising pattern: (1) an off-chain legal contract, (2) on-chain execution, and (3) a human-readable Ricardian bridge. The three must be versioned and connected, but no signature technique alone guarantees judicial enforceability.

Legal master	Articles of organisation and operating agreement identify the entity, members, class rights, decision thresholds, delegated powers, exit rules, conflict policies, IP and data licences, bank signers and dispute forum. They contain the actual obligations.
Execution record	Vaulta account permissions, timestamped proposal records, signatures and treasury transactions document execution. Start with narrowly scoped permissions and manual multisignature approvals; a custom contract comes only after a security review.
Ricardian bridge	Publish stable text for each action and terms version. Include a document ID, jurisdiction, rights conferred, party, signature method, effective time, amendment rule and hash. Verify how the actual wallet renders it; display is not automatic in every client.

The hierarchy is a legal question

The earlier line, "where paper and chain disagree, paper governs," is too absolute for a Wyoming DAO LLC. Wyoming law gives particular priority to articles and smart contracts in defined conflicts (W.S. 17-31-115). The operating agreement must be drafted to reconcile those rules. The controlling hierarchy and emergency correction process are an attorney deliverable, not an application default.

The voice and the bookplate

Red Door proposes reading the agreement aloud, retaining a recording, and signing a dated bookplate. Keep that ceremony as a record of deliberation and stewardship. It does not by itself transfer membership, title, or a legal share. Admission requires the actual articles/agreement, member register, signatures, and any applicable issuance or securities documentation. Keep recordings off-chain, with explicit consent and retention rules; do not record minors.

> State today: Contract terms, key custody, member register, Ricardian display and acceptance flows are proposals, not deployed or legally vetted.

30 Three classes; three rights

Copy the roles-and-rights architecture from Red Door, not its tenants, community land trust, revenue percentages or mailbox leases. Tokens are evidence or access mechanisms only to the extent the signed contracts actually grant the rights.

Class A - makers and keepers	Proposed governing members: admit rooms; approve budgets, makers, editions and vendor engagements; appoint or remove signers. Any payment for work is a contract or approved compensation, not automatically an investment distribution.
Class B - funders	Optional economic membership interests, if counsel approves an offering route. Percentages, governance limits, vesting, transfer restrictions and distributions are UNSET. These may be securities even if issued without a token.
Class C - players and students	A card and narrowly defined product/access licence; no company equity, no promised financial return. Adults can separately join a class only through explicit admission. Under-18s participate through education/guardian arrangements, not an investment class.

How a proposal moves

- Draft. Named human sponsor; scope, cost, conflicts, rights affected, term and transaction payload.
- Review and vote. Eligibility, quorum, class consent, notice and waiting period are in the master agreement. A data licence also requires each relevant person's permission; a company vote alone cannot grant it.
- Execution. Independent approvers compare the transaction with the approved proposal and execute through the entity treasury. Contract-side checks enforce room-specific limits.
- Audit. Publish proposal identifier, permitted vote totals, relevant transaction IDs and financial summaries; keep legal names, minors' records and personal information off the chain.

Four named signers are proposed: Beelal Fakhouri, Ulysses Newkirk II, Uri Heru House and Rob Konsdorf; three-of-four is a draft threshold. Rob's FACINGS role creates a related-party issue for FACINGS engagements. He should not sponsor, vote on or sign a conflicted vendor transaction, subject to counsel-approved rules; the remaining three would all need to sign under this threshold.

> State today: Class definitions are proposals. No Class B issued; no voting period, quorum, distribution, conflict rule or member transfer agreement approved.

31 The financial engine

The Red Door blueprint names Omnitrove, a delegated real-world asset manager and a 52/48 distribution trigger. Those are Red Door-specific proposals. For Negustolonow, copy the accounting principle and separation of authority, not the providers, capital structure or allocation.

Pot 1 - player assets	A player-controlled wallet is not the company treasury. A child's wallet, if used at all, requires guardian safeguards. No blanket assertion that every asset is recoverable is justified.
Pot 2 - entity assets	The LLC owns its bank accounts and, after formal assignment/control changes, its designated Vaulta treasury account. Named authorised signers pay salaries, materials, vendors, taxes and refunds.
Books and controls	Record every incoming amount as goods/service sale, non-deductible gift, grant or a separately compliant investment. Reconcile fiat and digital balances; require budgets, receipts, disbursement approvals and dual review.

Bank first; chain with reconciliation

A Michigan-facing operating business needs suitable banking, card processing, tax registrations, refunds and financial controls. Omnitrove is a possible treasury tool after independent diligence, not a bank or proven universal off-ramp. FACINGS card settlement, cash-out and company custody need written agreements and a live tested flow before launch.

Never say every gift is matched: no matching pool has been funded and quadratic-funding rules have not been published. Do not take investment proceeds through a founder wallet or treat a crypto transfer as a compliant securities subscription. Offering exemptions, investor verification and custody/escrow rules need separate counsel review.

No 52/48 revenue split is adopted. No distribution should be scheduled without solvency, tax, minority-rights and operating-agreement checks. A proposed maker collection fee is marketplace-dependent, not an enforceable resale royalty across all sales.

> State today: No new-company bank account, finance mandate, Omnitrove integration, matching pool, Class B issue or automatic sweep exists.

32 Wyoming in Detroit

Formation and foreign qualification

If the Wyoming DAO LLC route is chosen: file Wyoming DAO LLC articles, obtain a Wyoming registered agent, include required notices and applicable smart-contract identifiers, and determine whether Michigan foreign LLC registration (LARA form 760) is required for actual Detroit operations. Obtain state and local tax, zoning, licensing, insurance and employer advice as the activities require. The Detroit workshop is a location, not evidence the new entity is already authorised there.

Offering and member-rights review

Wyoming's DAO statute does not excuse federal securities rules or Michigan rules that apply to offers and business conducted there. The Michigan MILE exemption cannot simply be imported to a Wyoming-organised issuer. Federal Rule 506, Regulation Crowdfunding and other paths are possibilities to examine, not pre-approved alternatives.

Wyoming member rights may be materially different from an ordinary LLC, including the statutory notice, default treatment of member interests, transfers, withdrawals, default voting/quorum, fiduciary duties and dissolution. The company documents must state actual rules and should contain no promise that a departing funder receives all unspent money.

Other obligations

- A token representing a physical print does not alone transfer legal title or remove sales-tax, consumer, delivery or refund duties; those terms belong in the sale.
- Minors' workshop work requires guardian and safeguarding policies; credit, IP licences and any commercial use need consent, not an assumption that unpaid student labour is unregulated.
- Public blockchain activity may be linkable to identity. Attendance logs, children's work and personal data should stay private, with data minimisation and specific licensing.
- No paid chance-based prizes, no guarantee of exchange value, no claim that "utility" status by itself resolves securities, gaming or money-transmission questions.

> State today: Draft direction only. Obtain Michigan and Wyoming counsel and a written tax/securities analysis before formation and solicitation.

33 What we copy; what we do not

Keep intact	Three-part contract stack; role-based three-class architecture; human-voted governance; a real bank beside an auditable chain; local making and digital twins; intergenerational skill transfer.
Adapt to the house	Class A becomes makers/keepers; B is optional funders, not a CLT; C becomes players/students, not virtual leaseholders. Production dockets replace real-estate parcel logistics.
Exclude	Red Door's 52/48 split; "ESOP" as a loose term; physical tenant leases; USPS 4C mailboxes and 1:5 locker rule; BG Lionstar as assumed manager; any implication that access tokens equal crowdfunding.
Do not overclaim	A voice/bookplate is not a share certificate; a Ricardian clause is not assured enforceability; Nextcloud is not automatically a web/captive portal; a mesh radio is not a broadband Wi-Fi replacement.

5t-0_0-piD: educational parallel, not the Seed

The blueprint also proposes 5t-0_0-piD, a cross-generational print-shop assistant: older craftspeople teach production rules while young makers build the interface, file routing and control logic. That fits Make Your Own, Kid! as a workshop path. It is not evidence a local community intelligence is trained or operating.

The last print-shop direction in the source changes from Fiery to Canon PRISMAsync, alongside OrcaSlicer for 3D preparation. Those require separate, permissioned integrations. OrcaSlicer is a slicer, not by itself a shop-wide scheduler. A Pi 5 with 1GB cannot be assumed to run Nextcloud, Minecraft and a local language model together; the standard AI HAT+ accelerates selected vision workloads, while AI HAT+ 2 supports local generative models.

The Red Door PDF also contains long AI-chat demonstrations, suggested events, prototype ideas and unverified technical outputs. Only its stated intentions and actual tested deliverables should enter investor material, each marked as a plan or as completed evidence.

> State today: Red Door source reviewed as a planning document. No joint entity, technology deployment or written partner contract established by the PDF.

34 The order to make it real

- 1. Assign the scope: TechniBears products and IP, workshop provider, proposed DAO, issuer and holders. Obtain written permissions to name partners.
- 2. Select the jurisdiction: Michigan/ Wyoming comparative memo from counsel, including MILE eligibility, banking, tax and member rights.
- 3. Sign the legal master: articles, agreement, member register, class rights, governance/conflict policy, IP and data terms. Add optional voice/bookplate ceremony afterward.
- 4. Secure the account: identify and back up existing keys, assign the treasury to the entity, trial owner/active threshold changes and recoverability. Reconcile bank and chain. No payment by an undisclosed related party.
- 5. Prove one good: print one of the three print-ready jewellery pieces, produce an order/production record and document the seller's consumer obligations.
- 6. Prove optional ledger: agree issuer terms with FACINGS, test the collection on the chosen chain, issue one capped print claim and redeem it for one numbered piece; test the no-chain fallback.
- 7. Prove optional chip: independent challenge-response in a real browser; assess chip transplantation, replay, phone coverage and contract verification. Never market it as object identity.
- 8. Run a real room: paid and consented workshop, guardian controls, two-person attendance and clearly measured outcomes. Keep children off the public ledger.
- 9. Add game/access rights: only after contracts and room powers are tested, then measure fulfilment, customer support and resale limitations.
- 10. Explore local AI: separate educational 5t prototype from SESHAT; obtain individual data licences before any pooled use and independent governance vote thereafter.

What a first funder should underwrite

A bounded pilot: one printed design, one real workshop, one human-readable contract stack, one independently checkable production record and a public cost/fulfilment report. The ledger and Seed remain optional milestones, not prerequisites for a useful object.

> State today: None of the new-entity, ledger, chip, game or Seed milestones is represented as completed. Existing house/Arena/workshops remain separately documented.

35 What is settled and open

What we can say now

- The house site exists. Print-ready jewellery meshes and the Arena alpha exist. Workshop activity is reported at Red Door. Production, paid sales, game, token issuance, new entity and SESHAT remain future milestones.
- Negustolonow prefers value before any token; the on-chain record is a supporting receipt for a physical/digital right written in plain language.
- The Red Door blueprint supplies a proposed governance pattern: legal master, on-chain execution, readable Ricardian bridge, three different stakeholder rights, and a real-world operator.
- Existing Vaulta accounts are under their current single-key arrangements unless and until a verified authorisation change occurs. Four prospective signers and three-of-four are an unexecuted draft.

The decisions still requiring actual approval

Legal route	Wyoming DAO LLC with Michigan foreign qualification, or Michigan LLC with DAO-style operating agreement; legal analysis and chosen state formation documents.
Membership	Class A eligibility, optional Class B offering route and economics, Class C terms, minor protections, quorum and veto/dispute process.
Partner contracts	Red Door operator/site agreement; FACINGS issuing/payment scope; ownership and brand permissions; any 313af.space commerce terms.
Treasury	Keyholder appointments and recusal, payment classification, banking/processing, custody, fiat/chain reconciliation and the future of the founder-controlled BTC address.
Product pilot	First manufactured object, price, fulfilment terms, the first funded workshop and the viability of token redemption.
Privacy and AI	Informed data licences, guardian controls, encryption architecture, independent evaluation of 5t-0_0-piD, and any separate SESHAT research protocol.

> State today: The decision log now records the corporate route as OPEN, not chosen. No stakeholder class, investment terms or issuer mandate has legal effect.

36 Failures we must design for

Formation mismatch	Copying a Wyoming DAO LLC label while using Michigan-only filing/rights; obtain jurisdiction memo and correct articles, notice, operating agreement and tax plan.
Class B solicitation	Calling an economic interest a token, donation or access card does not remove securities requirements. Do not offer it before exemption, disclosures, custody and agreements are resolved.
Treasury keys	Single-key loss, signer collusion and a vendor conflict. Backups, testnet rehearsals, hardware keys, independent approvals and a recusal procedure are gating controls.
Supplier certainty	FACINGS, Red Door, AtomicHub and Omnitrove are distinct relationships; no vendor is treated as contracted or tested solely on the basis of the blueprint.
Object provenance	A token cannot manufacture an object; an NFC chip can be transplanted. Document production, the handover, consumer rights and tamper/replacement processes.
Children and data	Public accounts may be linkable; training can persist beyond key deletion. Use individual permission and guardian controls, minimised off-chain records and no claims of guaranteed model unlearning.
Mesh and offline	RaspAP provides local access; Meshtastic supports small messages; an internet tunnel needs connectivity. Demonstrate a no-internet session, not an assumed "offline web".
Edge AI capability	Pi 5 at 1GB and ordinary AI HAT+ will not support the proposed entire generative-AI/Nextcloud/Minecraft stack. Scope hosts and accelerators and benchmark.
Funding promise	No live quadratic funding or guaranteed matched gift; never solicit on the basis of an unfunded matching pool.
Speculative peace outcomes	SESHAT and a mediated public-space peace table remain research ideas. No two-room resolution or civic implementation has been demonstrated.

Partner conflict

Rob Konsdorf's prospective role at both the issuer and treasury requires disclosure, nonparticipation in the relevant governance approval and an independent commercial review. Under a three-of-four threshold, the other three all have to approve and sign; the agreement needs a fallback for unavailable signers.

> State today: These risks remain open. A plan or source document is not evidence that any mitigation has been tested.

37 Words and claims that hold

Do not say	Say instead
"Registered DAO"	"Proposed Wyoming DAO LLC / Michigan foreign qualification, or Michigan LLC with DAO-style governance; jurisdiction to be chosen."
"Paper always prevails"	"The legal hierarchy is jurisdiction-specific; articles, operating agreement and smart-contract priority require counsel review."
"Every partner holds a key"	"Four prospective signers have been named; the existing accounts still require a verified permission migration."
"The class owns 48%"	"Class B economics are unpriced, unsigned and optional; Red Door's 52/48 distribution does not apply."
"Access is crowdfunding"	"Class C is product access only, with no investment rights; economic interests require a separate compliant offer."
"Your donation is matched"	"Quadratic matching is being researched; no matching pool or round exists."
"Bookplate proves ownership"	"A bookplate marks an individual's signed participation; admission and legal rights follow the governing documents."
"The Seed forgets you"	"Records can be deleted subject to system design and retention; prior model learning may persist."
"An AI HAT runs the assistant"	"A particular edge model must be measured on compatible host and accelerator; ordinary AI HAT+ does not support LLM inference."
"The mesh is secure Wi-Fi"	"RaspAP is local Wi-Fi; Meshtastic is low-bandwidth message transport; signatures and access controls are separate."
"The NFT proves the object"	"The record identifies a claim or piece; a cryptographic chip authenticates its own key, not the entire object."
"The market enforces royalties"	"Any secondary fee depends on the specific marketplace or contractual resale route."

Keep the words "State today" at every stage. A proposal becomes a claim of completion only when the proof is dated, inspectable and supported by the responsible party.

> State today: This supersedes the conflicting Michigan-only and matched-funding language in the earlier glossary.

WE WILL NOT SAY	WE SAY
The Seed decides; peace by AI	The Seeds carry and translate; people decide and ratify
In partnership with Block by Block	After the UN-Habitat Minecraft programme, Block by Block: a nod, and an experiment

> **State today:** In force for this document. Nothing has been said publicly about the company.

The SESHAT Seed Project

- Introduced by Uri Heru House, in conversation; description as passed on by Beelal Fakhouri, 2 Oct 2026. It is the only source on SESHAT, and the quotations in sections 3 and 16 are from it.

Working documents

- The studio's own records, from which this document is condensed: `55-product.md`, `56-make-your-own-kid.md`, `57-negustolo-dao-llc.md`, `58-inbox.md`, `60-seshat-seed.md`.

> **State today:** Every source was read on the date given. No legal source has yet been checked by an attorney.

Appendix I - Offline and edge architecture

The Red Door operational sketch names PaperMC/Minecraft, Nextcloud, RaspAP, Meshtastic, Raspberry Pi, Nvidia Jetson, Canon PRISMAsync and OrcaSlicer. These technologies solve different problems. Treat them as a modular experiment, not one ready-made platform.

LAN and portal	RaspAP may manage a local wireless access point; an HTTPS service/portal must be built and hosted separately. Nextcloud is a file and collaboration platform, not the captive portal, WordPress, or public tunnel itself.
Community mesh	Meshtastic carries low-bitrate, signed status/events and short messages. It does not carry Minecraft sessions or full internet access. Do not claim one whole authenticated event fits a packet until byte-budget tests pass.
Game and files	PaperMC requires a properly sized host and compatible Java version. Nextcloud needs supported deployment, storage, updates and backups. A public tunnel works only when an upstream internet connection exists.
Production	A shop-controlled queue API or bridge must mediate Canon PRISMAsync and 3D printers. OrcaSlicer exports toolpaths; it is not a validated multi-printer scheduling service by itself.
Local AI	The standard Raspberry Pi AI HAT+ does not run LLMs; the HAT+ 2 or suitably sized Jetson/other host can be evaluated for on-device models. A Pi 5 with 1 GB is a thin controller, not the entire stack.

Required pilot tests

- Print-shop device inventory, API/licence permissions, protected operator controls and a manual override.
- No-internet drill with RaspAP/Meshtastic; distinguish local-Wi-Fi availability from mesh reachability.
- Measured memory/load, thermal and model-licence budgets before naming hardware as a production specification.

> State today: This is a design correction to the Red Door workshop vision, not a claim the stack has been installed.

Appendix II - Rights and provenance

Physical goods + tokens

A printed part, its on-chain record and its legal rights are three separate things. Publish the object specification, edition/piece number, delivery/refund warranty, licensed design use and transfer conditions. A token does not force off-chain delivery or continued hosting. Signing NFC proves a response from one chip key, not the unaltered identity of the piece.

Accounts and permissions

A restricted Vaulta permission is not sufficient by itself to confine a gamemaster to a room. Each game action must check caller account, permission, venue, nonce and role inside the executing contract. Hardware-backed keys, approvals, revocation, testnet rehearsal and audit trails are acceptance criteria. Never equate token ownership with the actual holder of a physical object unless a documented handover links them.

Consent and children

The player card signifies a physical choice only when a documented off-chain process defines that choice. Guardian verification, withdrawal and purpose-specific licensing are needed. A public vote by the company does not replace a creator's consent to train on their work. Encrypt session records by default, implement backup retention periods and avoid the misleading promise that deleting one key removes every copy or untrains a model.

Source status

Primary source: Architectural Blueprint for the Red Door Digital DAO, pp. 1-4 (executive structure and local network sketch), pp. 15-23 (shop/learning ideas), with later PRISMAsync changes. Source contains AI-chat speculation: the blueprint is evidence of planned architecture, not proof of deployment. Original Negustolonow proposal v2, especially pp. 26-41, supplies product-specific intentions.

> State today: No independent test or legal opinion is recorded in any of the three uploaded documents.

Appendix III - Verification references

The following sources were checked to distinguish legal/technical baselines from the Red Door brainstorming. Official primary materials should be rechecked by counsel and engineers as requirements evolve.

- Wyoming Legislature, Decentralized Autonomous Organization Supplement, W.S. 17-31 (including sections 104-115): wyoleg.gov
- Wyoming Secretary of State, DAO LLC Articles of Organization and instructions: sos.wyo.gov/Forms/Business/LLC/DAOLLC-ArticlesOrganization.pdf
- Michigan LARA, Form 760 Application for Certificate of Authority to Transact Business in Michigan: michigan.gov/lara
- Michigan LARA, Michigan Invests Locally Exemption (MILE), and MCL 451.2202a: michigan.gov/lara/bureau-list/cscl/securities
- Antelope developer documentation: ABI and Ricardian clauses; permissions and action links: docs.antelope.io
- Raspberry Pi official AI HAT+ and AI HAT+ 2 documentation: raspberrypi.com/documentation/accessories/ai-hat-plus.html
- Vaulta Omnitrove roadmap (vendor claims and product positioning): vaulta.com/resources/omnitrove-roadmap-fragmentation-to-orchestration

Definitions of status

Exists: supported by the studio's own dated evidence, separately verified where possible. Designed: written system not demonstrated. Proposed: a conditional relationship, legal mechanism or dependency without approval. Unverified: a claim present in the blueprint or proposal without supporting evidence, irrespective of how confidently it is worded.

Editorial revision dated 10 October 2026. This document is a rigorous source-alignment draft, not an attorney opinion or confirmation that any partner accepts the terms.

> State today: Company route, securities exemption, issuer, custody and user rights still require written selection and confirmation.
